Enrico Fermi Jul 09 2020 This biography explores the life and career of the Italian physicist Enrico Fermi, which is also the story of thirty years that transformed physics and forever changed our understanding of matter and the universe: nuclear physics and elementary particle physics were born, nuclear fission was discovered, the Manhattan Project was developed, the atomic bombs were dropped, and the era of "big science" began. It would be impossible to capture the full essence of this revolutionary period without first understanding Fermi, without whom it would not have been possible. Enrico Fermi: The Obedient Genius attempts to shed light on all aspects of Fermi's life - his work, motivation, influences, achievements, and personal thoughts - beginning with the publication of his first paper in 1921 through his death in 1954. During this time, Fermi demonstrated that he was indeed following in the footsteps of Galileo, excelling in his work both theoretically and experimentally by deepening our understanding of the Pauli exclusion principle, winning the Nobel Prize for his discovery of the fundamental properties of slow neutrons, developing the theory of beta decay, building the first nuclear reactor, and playing a central role in the development of the atomic bomb. Interwoven with this fascinating story, the

book details the major developments in physics and provides the necessary background material to fully appreciate the dramatic changes that were taking place. Also included are appendices that provide a timeline of Fermi's life, several primary source documents from the period, and an extensive bibliography. This book will enlighten anyone interested in Fermi's work or the scientific events that led to the physics revolution of the first half of the twentieth century.

Topics in Mathematical Physics, General Relativity, and Cosmology in Honor of Jerzy Pleba?ski Dec 02 2019 One of modern science's most

famous and controversial figures, Jerzy Plebanski was an outstanding theoretical physicist and an author of many intriguing discoveries in general relativity and quantum theory. Known for his exceptional analytic talents, explosive character, inexhaustible energy, and bohemian nights with brandy, coffee, and enormous amounts of cigarettes, he was dedicated to both science and art, producing innumerable handwritten articles - resembling monk's calligraphy - as well as a collection of oil paintings. As a collaborator but also an antagonist of Leopold Infeld's (a coauthor of Albert Einstein's), Plebanski is recognized for designing the "heavenly" and "hyper-heavenly" equations, for introducing new variables to describe the gravitational field, for the exact solutions in Einstein's gravity and in quantum theory, for his classification of the tensor of matter, for some outstanding results in nonlinear electrodynamics, and for analyzing general relativity with continuous sources long before Chandrasekhar et al. A tribute to Plebanski's contributions and the variety of his interests, this is a unique and wide-ranging collection of invited papers, covering gravity quantization, strings, branes, supersymmetry, ideas on the deformation quantization, and lesser known results on the continuous Baker-Campbell-Hausdorff problem.

GCSE Physics Question Bank Mar 17 2021 Teaching Science, I have always found myself to be jealous of Maths teachers. When they set an exercise from a text book there are always many questions for the students to practice the topic which has just been taught. Not only that but the questions are also not just from the initial perspective but are rearranged to find a variable which is not the subject of the equation. After that there are the questions in words rather than numbers and they always increase in difficulty throughout the exercise. The most common way in which I try to use text books is to set exercises from them after the topic has been introduced but I am always disappointed. It is not uncommon to find a Science text book with just 3 or 4 questions on a topic as wide as, say, momentum and so we science teachers use worksheets. Since no book existed that met my needs, I have written one. The aim of this book is not to show students how to solve Physics problems - the assumption is that that has already been done by the teacher using any of the methods in their pedagogical armoury. It is to give the students chance to practice those skills more than just a couple of times and to attempt problems posed from as many angles as possible. Where there is an equation, I have set problems which require rearrangement to solve for all variables. I have given questions in simple numerical form as well as in longer, "wordier" ways. I have kept pictures to a minimum as I find examinations do this too. Where appropriate, I have given the formulae in exactly the format of the AQA Specifications 8463 and 8464. "g" is also given as 9.8 m/s² as stated in the specification. I have noted within the questions whether the formula in question will be given on the Physics Equation Sheet or whether candidates are expected to recall it. I have varied units throughout so that students are expected to convert to

standard units before using formulae and, although I have attempted to keep numbers as "tidy" as possible (such as when students are expected to take a square root), there will be times when they will have to round to significant figures or decimal places, as stated in Mathematical Requirements (AQA Specification 8463 page 81 and AQA Specification 8464 page 163). I have tried to write everything from the point of view of the specification. You will find specification references at the beginning of every section and I have written questions relating to everything which appears within the specification. Where a specification section is small, I have merged it with an appropriate section. A couple of specification sections (Energy Stored in a Spring and Specific Heat Capacity) are repeated but I have only put one set of questions for each into the book. It was only near the end of the writing process that I discovered that the concept of giving the students lots of examples has a name - SLOP! (Shed Loads Of Practice.) If, like me, you subscribe to this idea then this book is for you. This book is written in the Comic Sans Serif font as I had it recommended as the most readable font by my school's SEN coordinator.
